# INTRODUCTION

NASA has a strong history of thoroughly planned flyby missions, yet responding to new data and challenges in flight requires flexibility and coordination among multiple cross-disciplinary teams, a balance which takes a great deal of time and resources to maintain. The Europa Clipper mission, currently in planning phases, is taking significant steps to improve the efficiency of operations so that planning takes much less time and fewer resources. Continuum, an integrated interface for planning and scheduling, is part of that effort. It allows instrument scientists to geospatially construct plans for spacecraft activity, visualize the effects of their plans on other teams and the spacecraft, and be aware of conflicts at all times.

Continuum is informed by in-depth interviews, collaborative design activities, concept testing, and usability testing with 21 NASA scientists, engineers, researchers, and designers. Every part of the UI responds to our findings or assumptions based on themes and insights generated during synthesis, especially its main functionalities - geospatial editing, computer-supported planning, and dynamic conflict resolution.

Continuum integrates crucial science planning functionality across JPL standard tools. It also allows scientists from different teams to import their own data and flight rules into the system for improved planning and computer support, reducing the need to switch back and forth between team-specific tools.

By supporting all teams with a unified interface, Continuum ensures better cross-team communication and more collaborative planning and scheduling.

Integration with the mission team's flight rules and spacecraft activity constraints ensures conflicts at the planning and scheduling level are discovered in real time, reducing the number of potentially harmful requests made. Whenever the computer provides support, either by providing results when searching for science opportunities or when suggesting courses of action for resolving conflict, the user makes the call. Computer-generated results are explained clearly and succinctly so the user knows how to respond.

# ARCHITECTURE

Documents the overall structure of the product by explaining its information hierarchy and interaction flow

# LAYERED VIEW

## Spatial View

The spatial screen is reliant on layered data, with each layer being built upon the one beneath. The bottom layer is the skeleton with a layer of camera imagery mapped on top, this gives all instrument scientist an understanding of actual geographical features for reference. Layered above the camera data is the actual instrument data layered on top, the team can set different opacity levels to see their data overlaid on the moon's surface. Finally a level of interaction controls and interface elements manipulate each layer and view below.

# LAYERED VIEW

## Timeline View

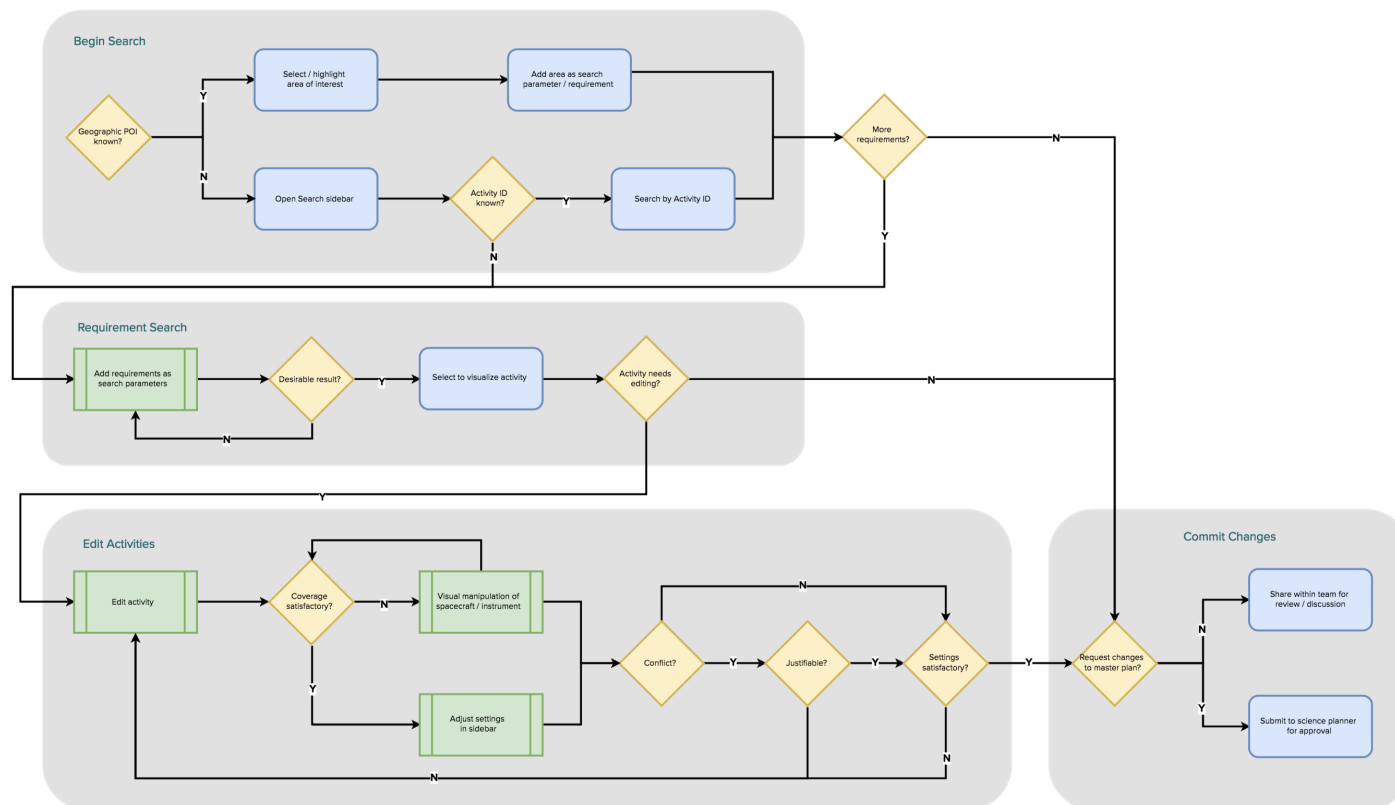

The timeline view is layered to make relevant activities grouped for easy access and comparison. The bottom layer is all instrument team activities with minimal annotations. Above that is everything conflicting with your current selections. Most prominently is your team's activities broken into minute detail. A layer of interface and UI wraps above every temporal layer allowing users to explore and resolve scheduling conflicts as they arrive.

# INTERACTION FLOW

## Searching for Opportunities

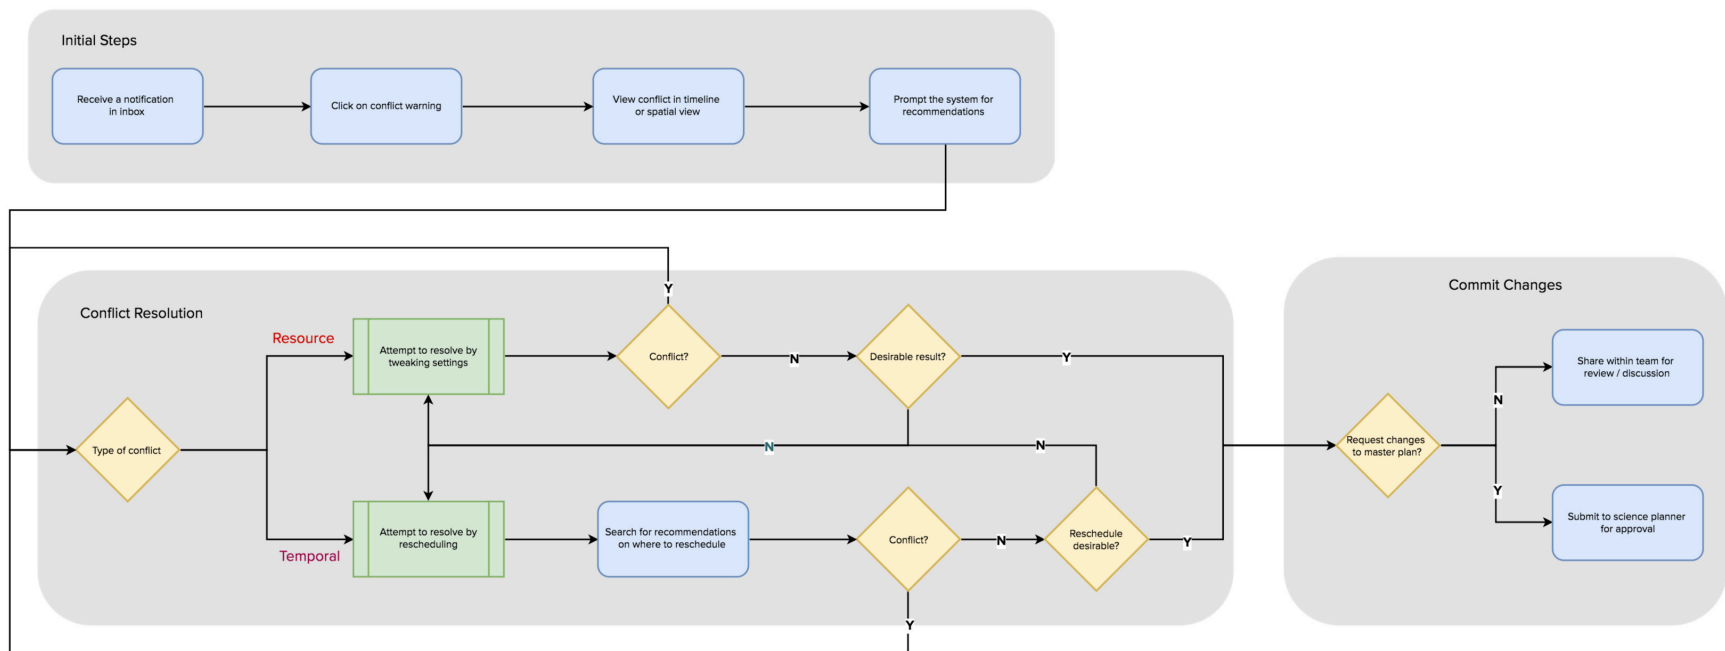

The following interaction flows detail Continuum's main functionalities: visual planning and conflict resolution. The first follows an instrument scientist's path from searching for opportunities to tweaking results to fit their desired results.

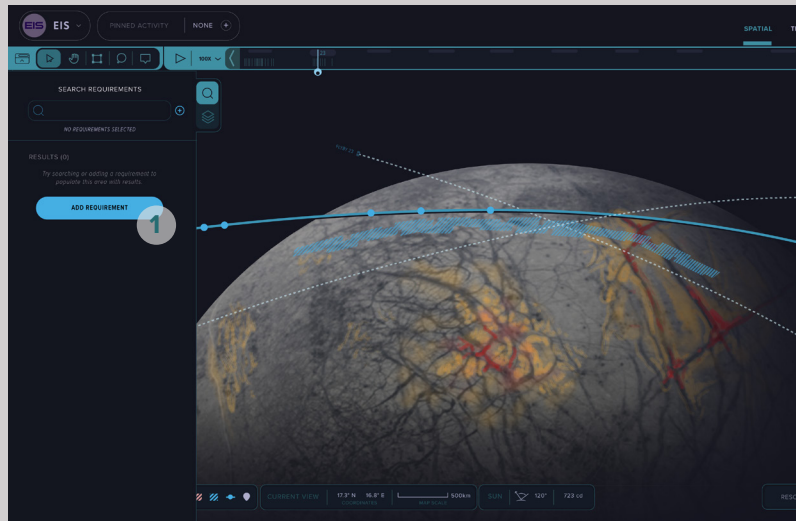

# INTERACTION FLOW

## Resolving Conflicts

The second follows an instrument scientist receiving a notification of a conflict with their instrument through possible courses of resolving that conflict.

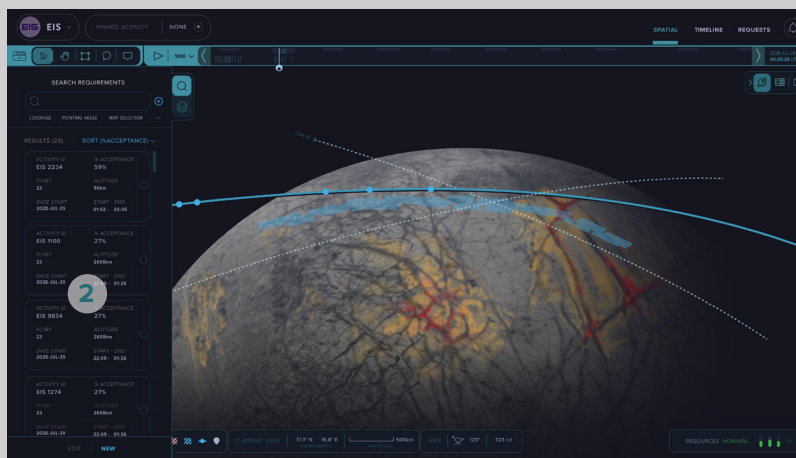

# MAJOR INTERACTIONS

1.

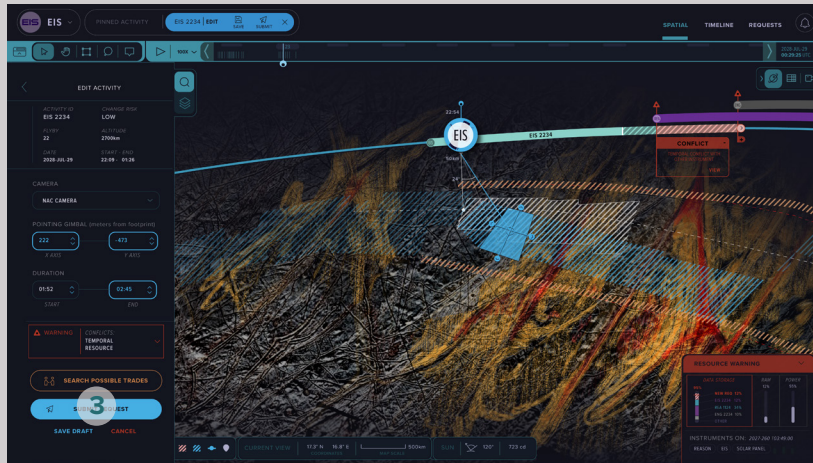

Users search for science opportunities by adding their own requirement

2.

The system offers a list of suggested science activities that meet their requirement.

# MAJOR INTERACTIONS

3.

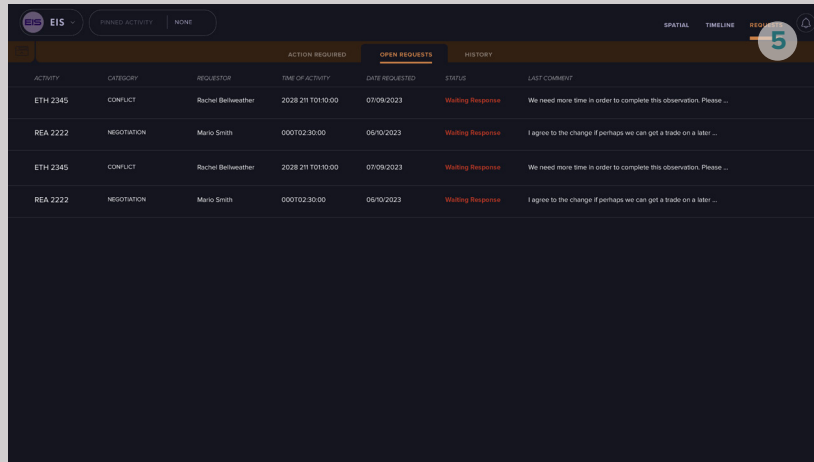

After the suggested activity is selected, users could change the parameter to further meet their science requirements. Conflicts will popup both textually and geographically when new adjustments violate safety rule or conflict with other teams' activities. Users could submit request to the one conflicted with for negotiation.

4.

Switch to timeline view too see how selected activity conflict with other activities temporally.

ACTIVITY

ES2234

DESCRIPTION

Changed pointing of NAC and observation duration in order to fully capture possible plume location (Site Number: 52 R)

JUSTIFICATION

Further's L2 science objectives by gathering additional imaging data on a possible plume location. Possibility for other instruments to capture simultaneously.

Users can see all details of request. They can view the negotiated activity both in timeline view and geographical view.

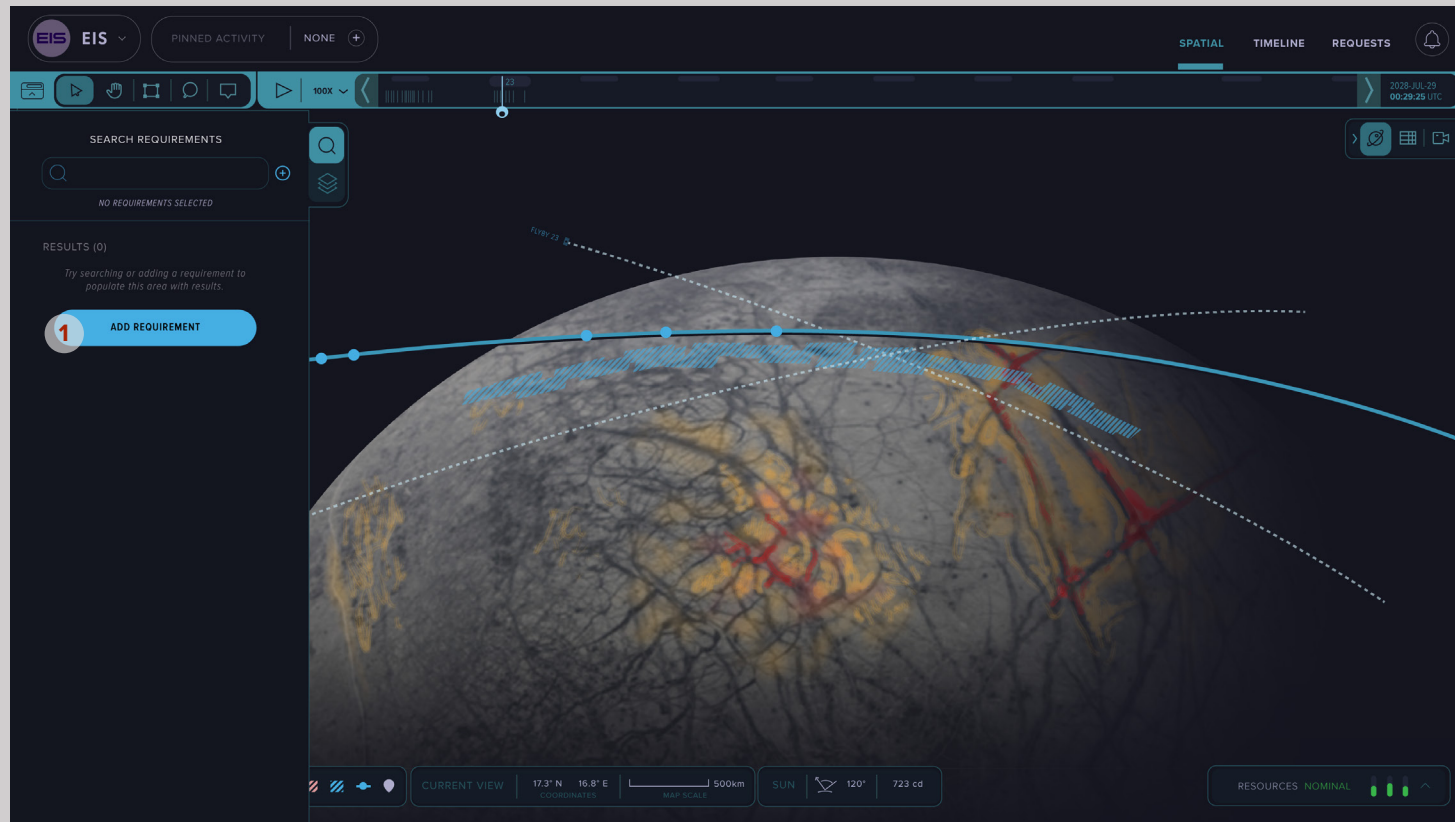

## HERO FLOW

Shows the primary use cases of the product and explains interactions step by step for achieving certain goals. It further details common use cases outlined in our interaction flows.

# HERO FLOW

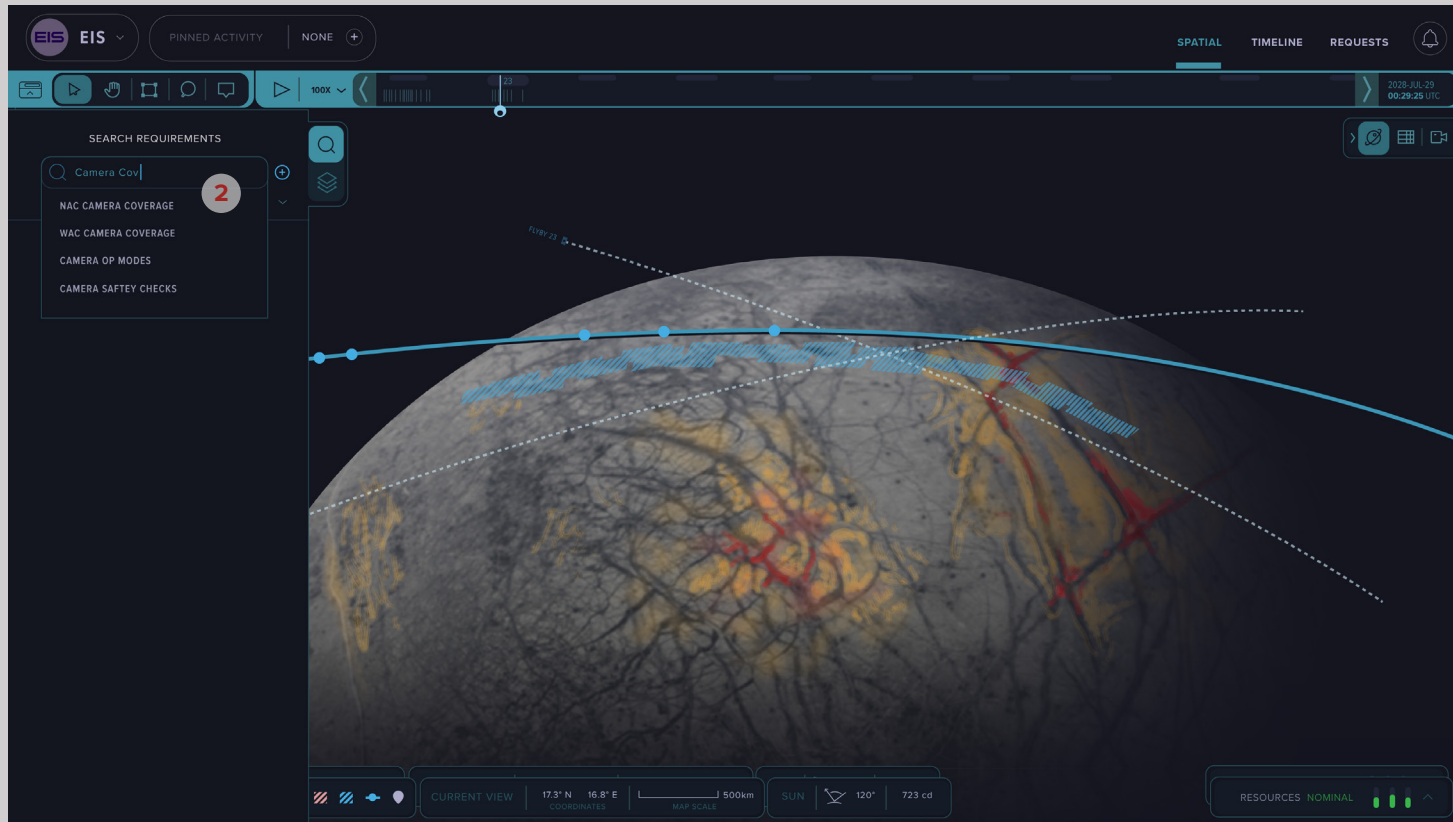

## 1.1 Opportunity Searching

Helen, a scientist on EIS, Europa Clipper's camera team, has received notification of exciting new data and wants to see if EIS has an opportunity to image it. She starts by adding a requirement or parameter to her search.

# HERO FLOW

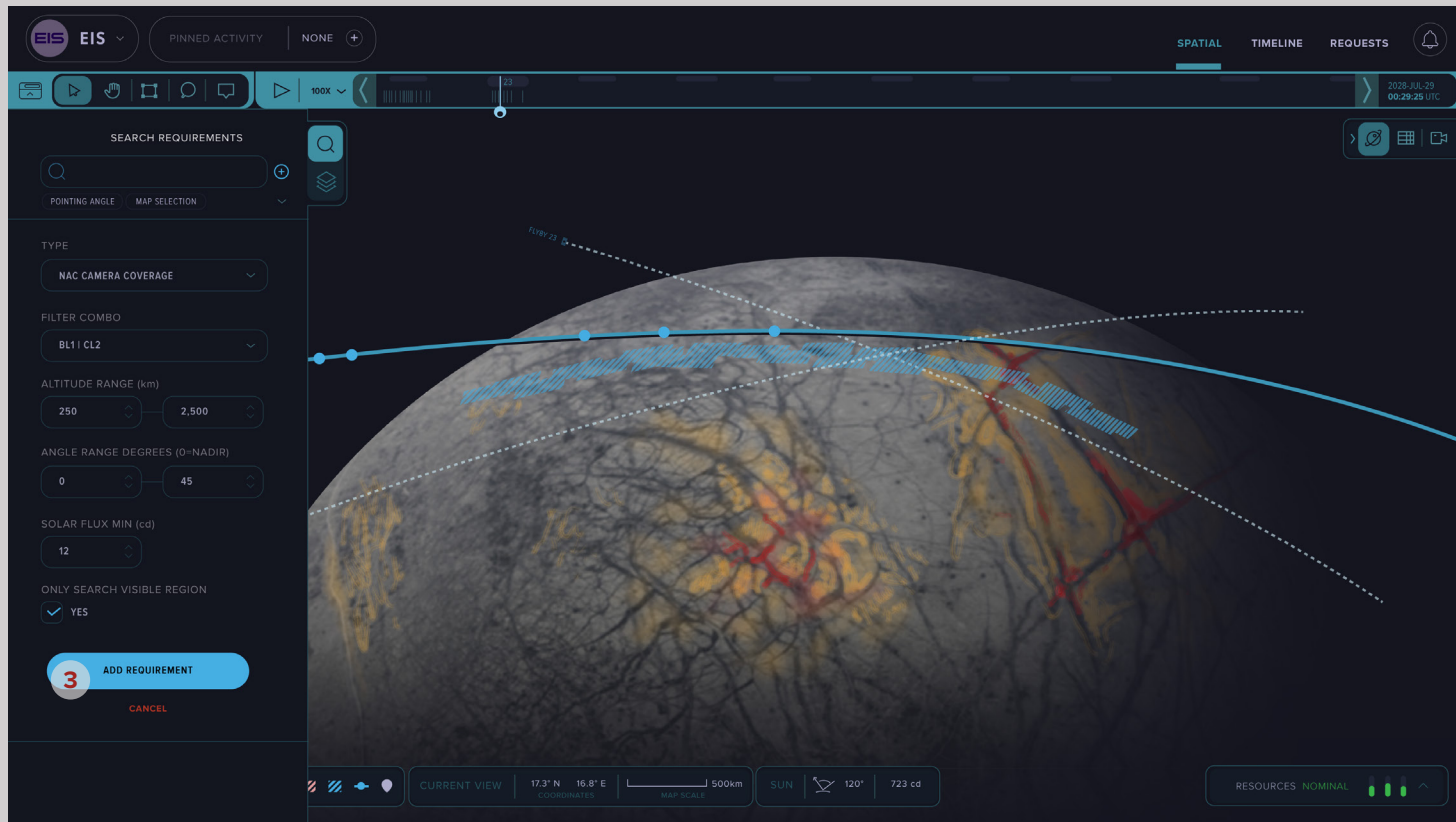

## 1.2 Planning

Clicking on “Add Requirement” allows her to search for opportunities by defining parameters.

# HERO FLOW

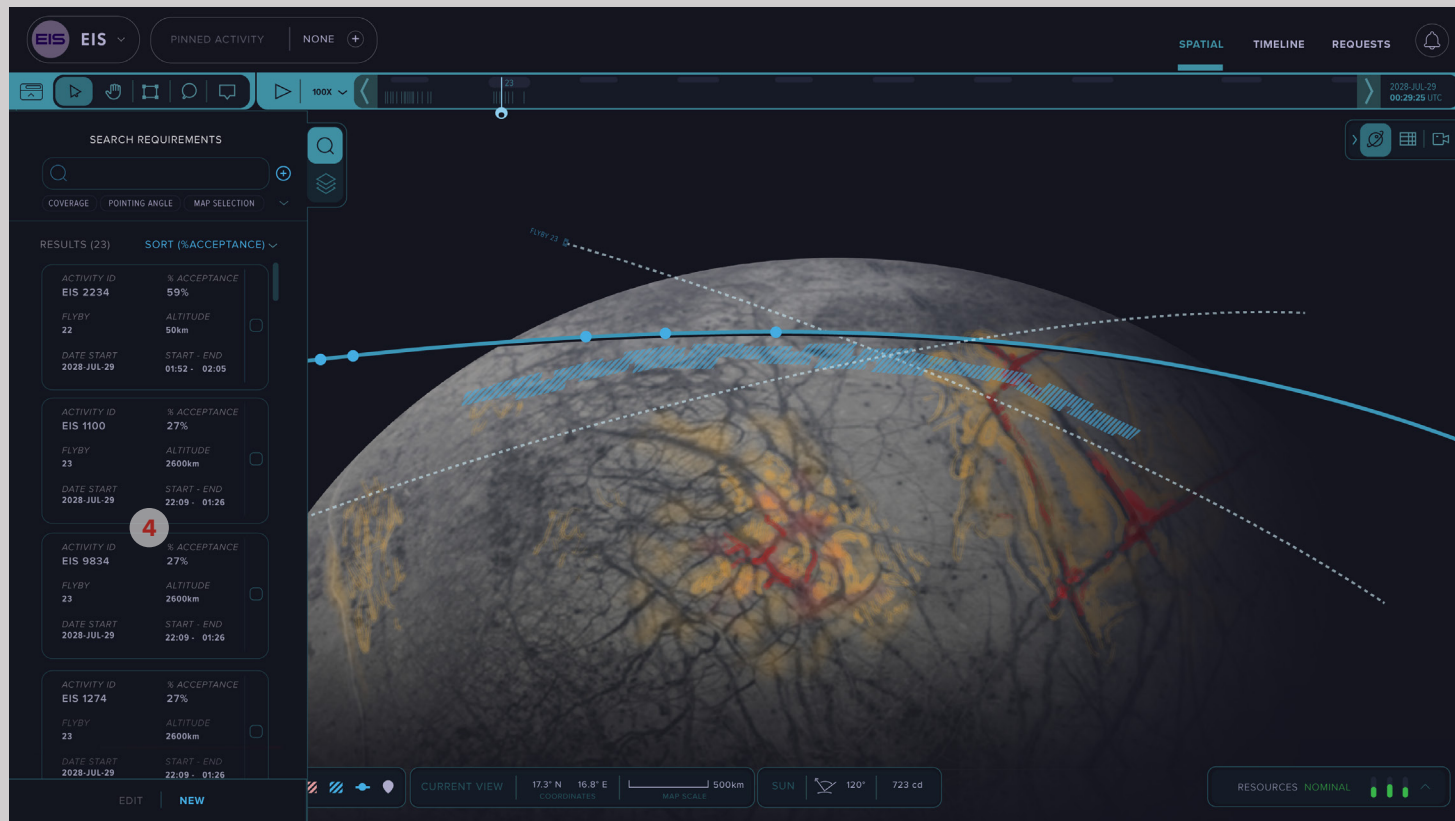

## 1.3 Planning

The search sidebar allows Helen to define parameters on her search based on instrument settings. She can tell the system she only wants to look at opportunities within a certain altitude range because she knows that range is optimal for the type of observation she'd like to make. Then she hits “ADD REQUIREMENT”.

# HERO FLOW

## 1.4 Planning

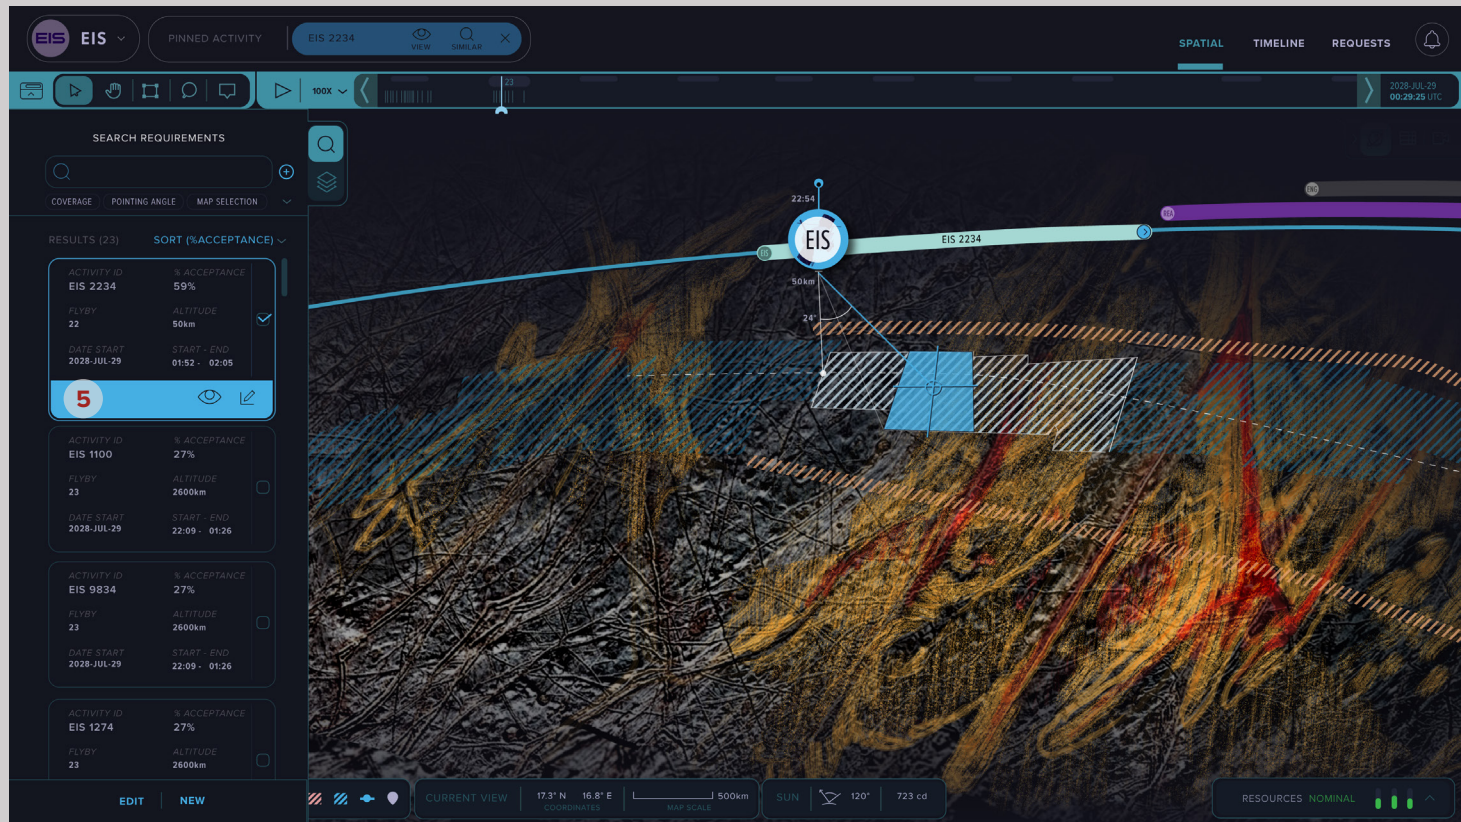

Once she has entered her requirements, the system returns a list of already-scheduled observation opportunities that match her search requirements to varying degrees. “% acceptance” tells her how close the observation comes to her requirements.

# HERO FLOW

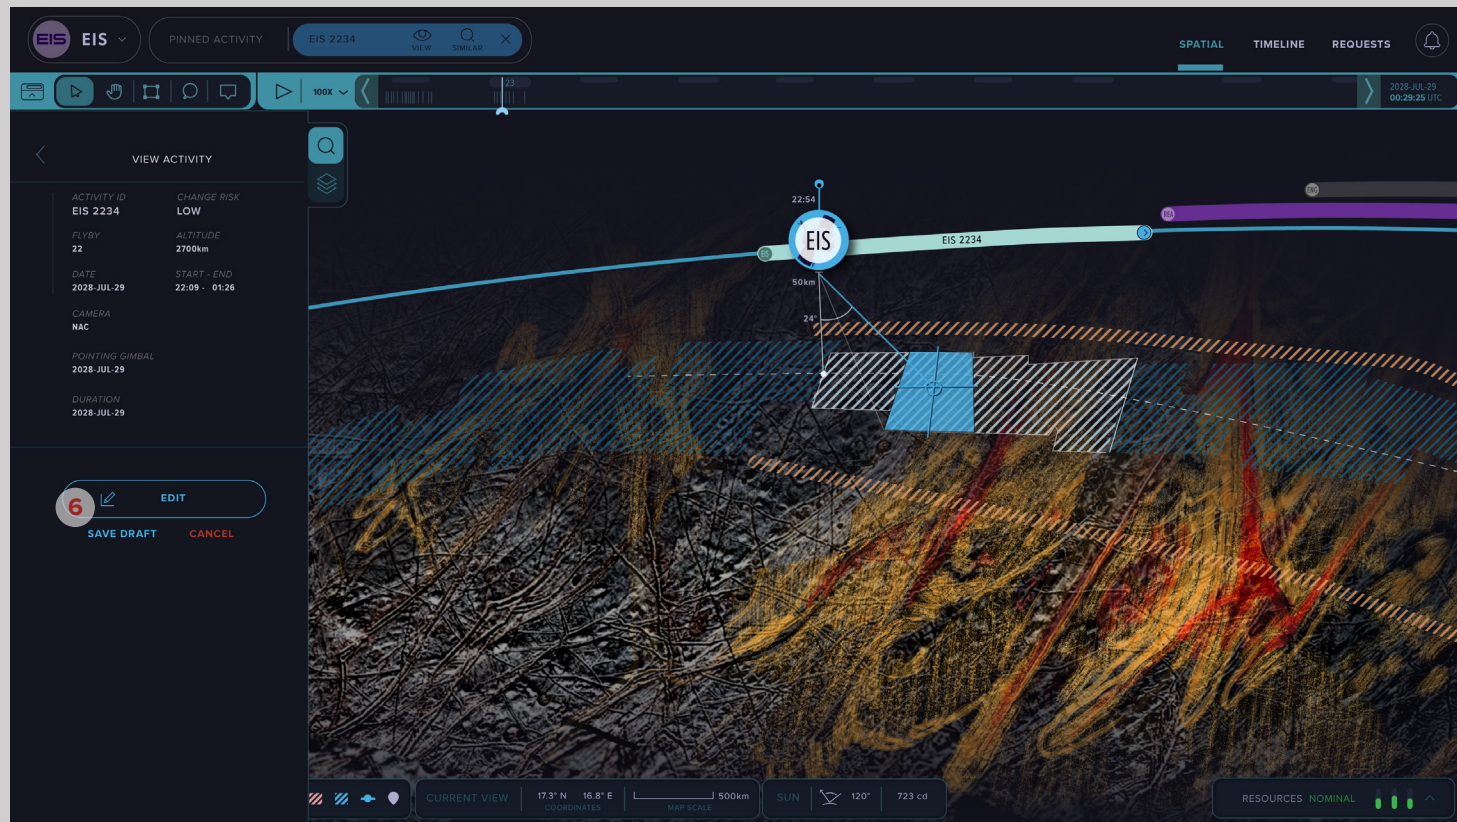

## 1.5 Planning

Helen clicks through the search results to see visualizations of each spacecraft activity, like where in the flight plan they occur and what she can observe with them.

# HERO FLOW

## 1.6 Planning

She finds an activity that comes close to her requirements for this particular observation, but it doesn't cover the whole area she wants to image. She pushes Edit button to edit the activity.

# HERO FLOW

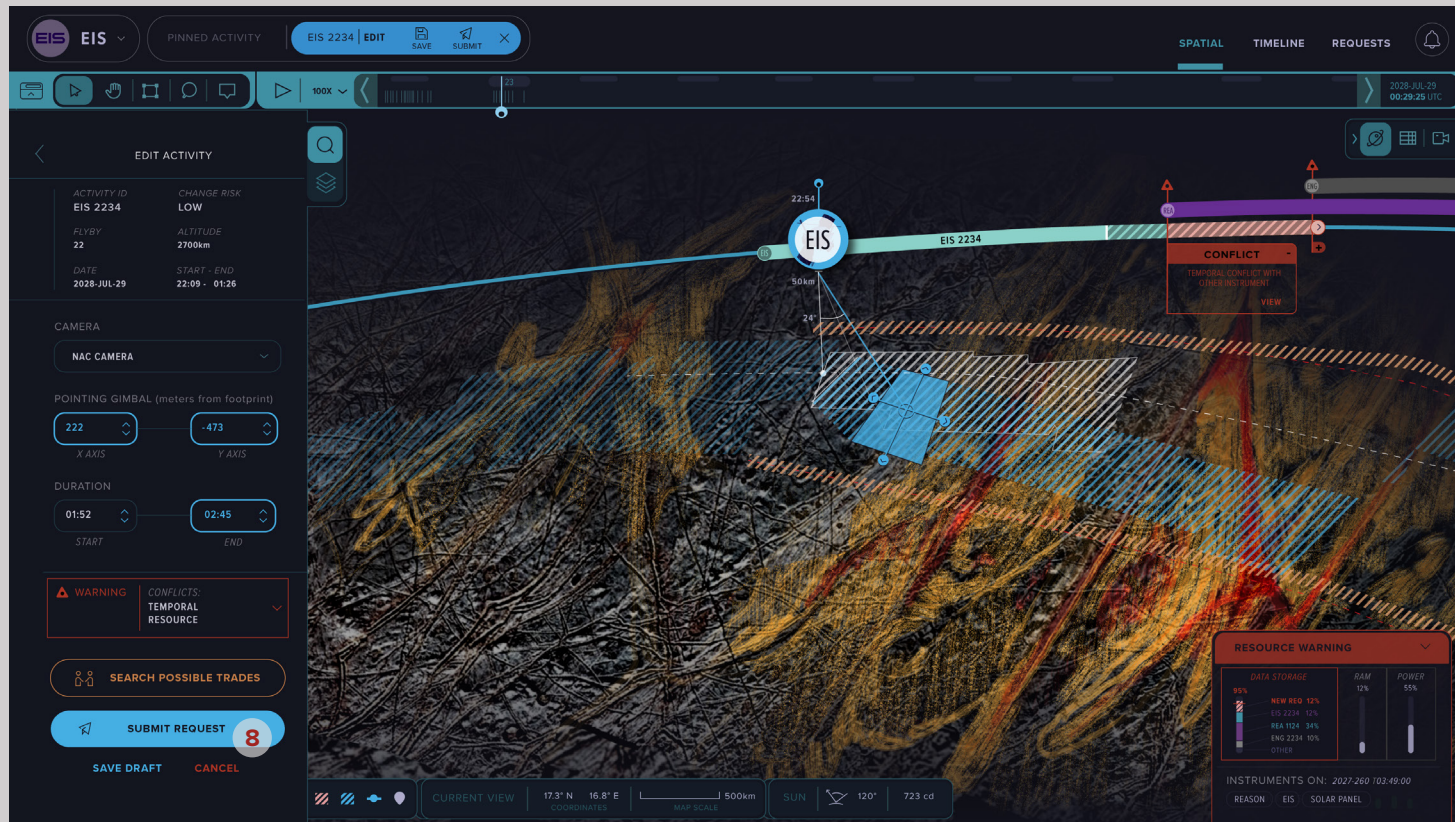

## 1.7 Planning

Entering edit mode, Helen tweaks the activity and the visualization shows her the effect her changes have on the spacecraft and what she can observe.

# HERO FLOW

## 1.8 Planning

Every time Helen makes a change that breaks a flight rule or affects another team, the system warns her and clearly and succinctly explains the problem. In this case, she has extended the duration of her observation to capture the entirety of the desired area, which takes time and resources away from other teams. She decides to submit a request for the changes anyway because this observation is high priority for her team.

# HERO FLOW

## 1.9 Planning

The screenshot displays the HERO FLOW interface with a 'SUBMIT CHANGE REQUEST' modal open. The modal contains the following fields and sections:

- ACTIVITY ID:** EIS 2234
- DESCRIPTION OF CHANGES:** POINTING | DURATION ...
- TEAMS AFFECTED:** REASON | ENGINEERING
- WARNING:** TEMPORAL CONFLICTS:
  - REASON ACTIVITY 1124
  - SOLAR PANEL ROTATION
- REASONING FOR THIS CHANGE (REQUIRED):**

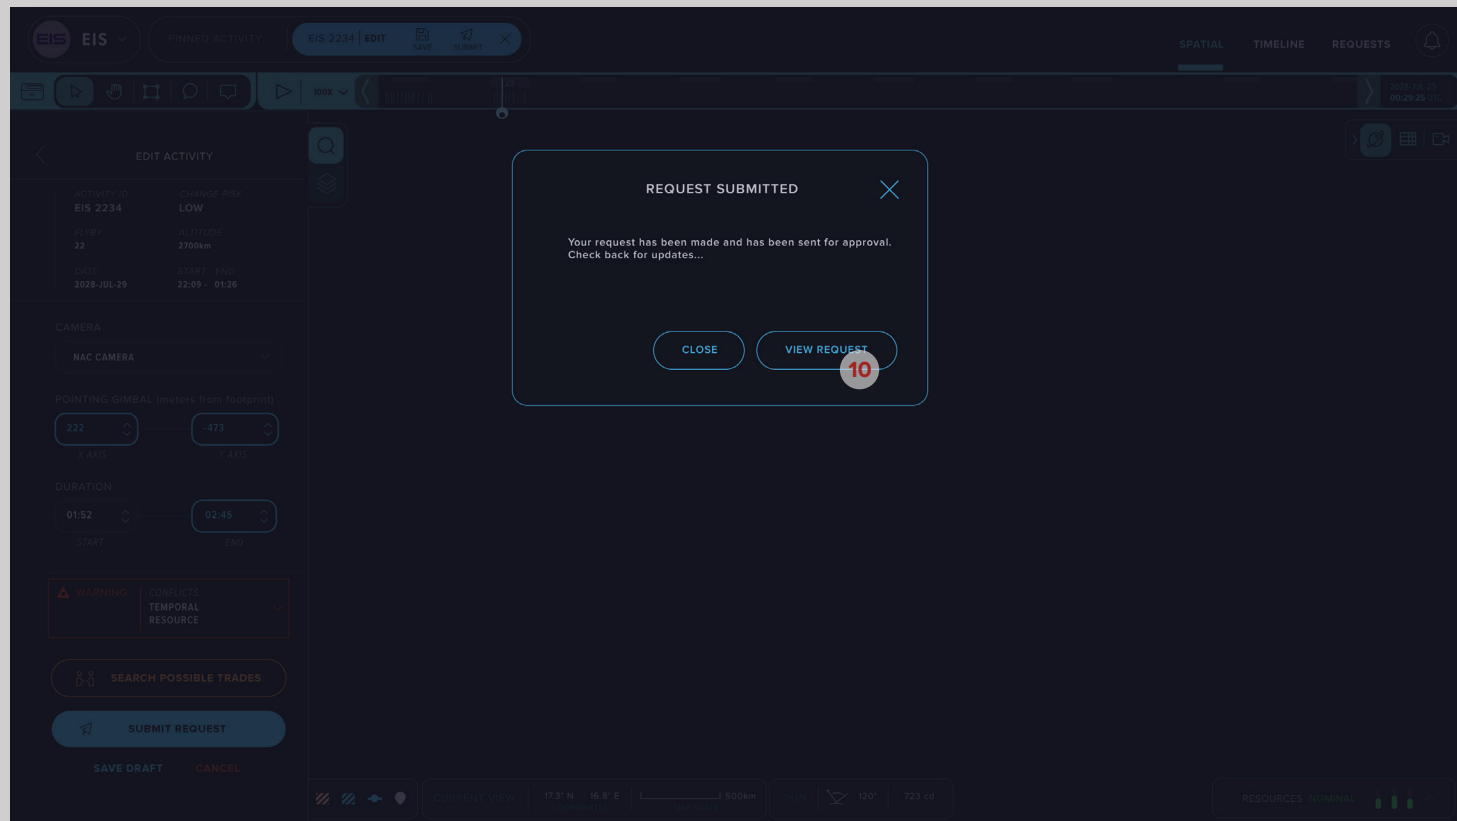

As we discussed last conference, potential plume locations are a level 2 science objective. We think UVS might of uncovered a potential plume. Check the spatial view and see for yourself :)
- Buttons:** CANCEL, SUBMIT REQUEST (with a red '9' badge)

The background interface shows the 'EDIT ACTIVITY' panel for EIS 2234, including fields for ELEVATION (22), ALTITUDE (2700km), DATE (2028-JUL-29), START (22:09), and END (01:36). It also features a CAMERA dropdown (NAC CAMERA), POINTING GIMBAL (222, 473), FOCUS (4.450, 4.450), DURATION (01:52, 02:45), and a 'SUBMIT REQUEST' button at the bottom.

When Helen submits her change request form, a warning once again reminds her of potential conflicts. The system requires her to write a justification for her changes so that other teams and science planners know she has good reason for making conflicting changes.

# HERO FLOW

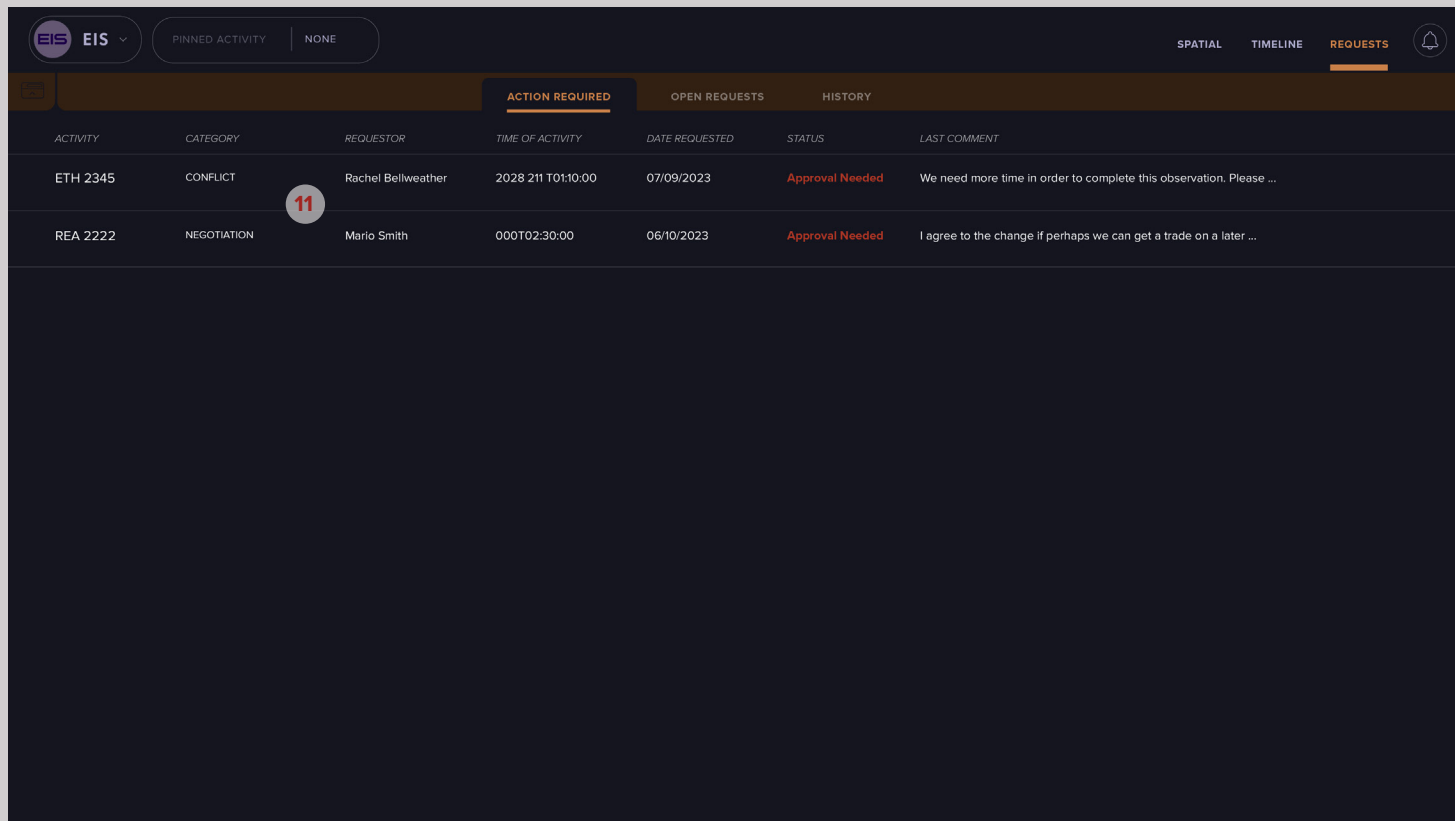

## 1.10 Planning

After hitting “Submit,” Helen can view the details and status of her request.

# HERO FLOW

## 1.11 Planning

The screenshot shows the HERO FLOW interface with the 'REQUESTS' tab selected. The interface includes a top navigation bar with 'EIS' and 'EIS' dropdown, 'PINNED ACTIVITY', and 'NONE'. The 'REQUESTS' tab is highlighted in orange. Below the navigation bar, there are three sub-tabs: 'ACTION REQUIRED' (highlighted), 'OPEN REQUESTS', and 'HISTORY'. The main content area displays a table with the following data:

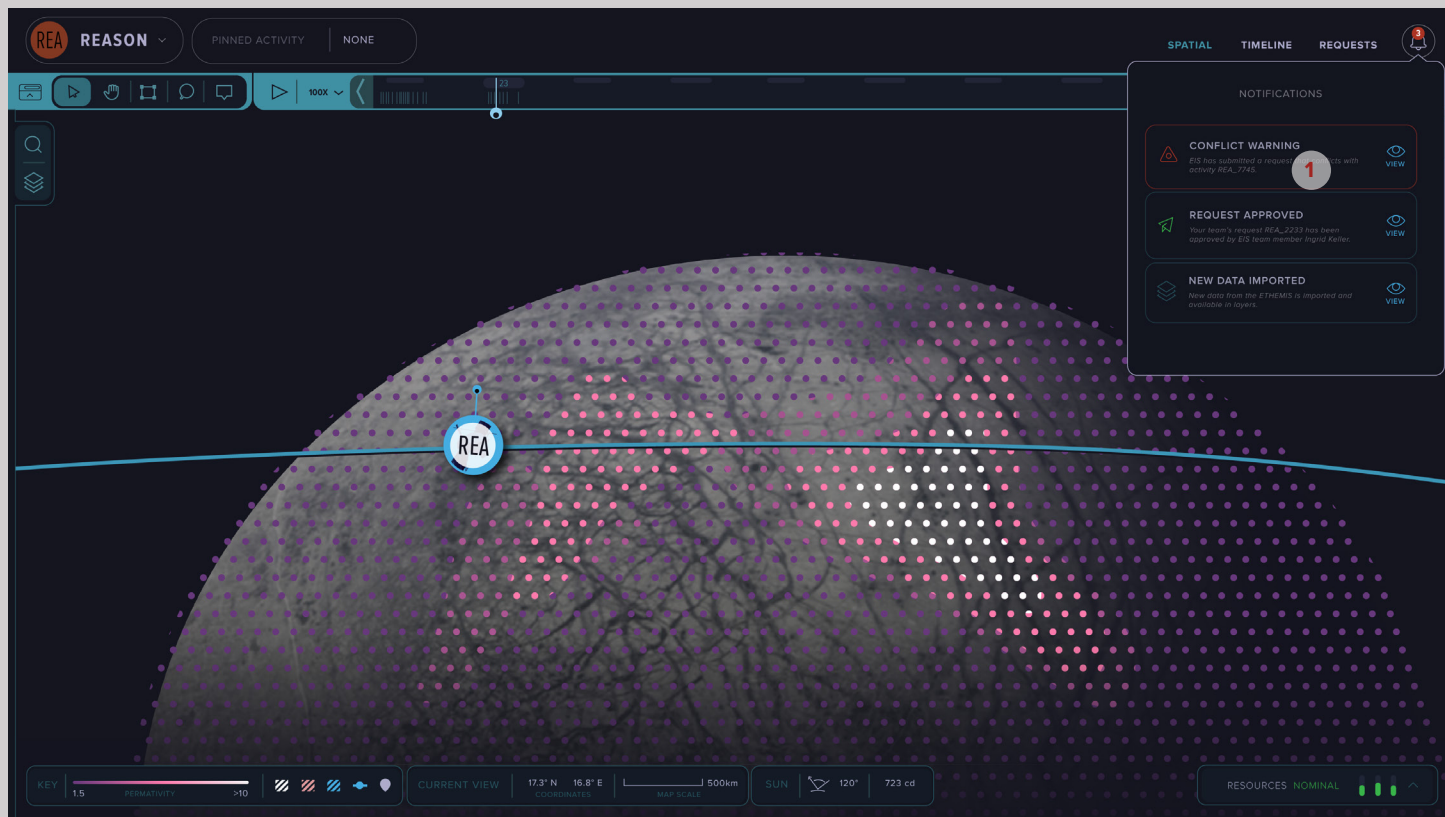

ACTIVITY	CATEGORY	REQUESTOR	TIME OF ACTIVITY	DATE REQUESTED	STATUS	LAST COMMENT
ETH 2345	CONFLICT	Rachel Bellweather	2028 211 T01:10:00	07/09/2023	Approval Needed	We need more time in order to complete this observation. Please ...
REA 2222	NEGOTIATION	Mario Smith	000T02:30:00	06/10/2023	Approval Needed	I agree to the change if perhaps we can get a trade on a later ...

A red circle with the number '11' is overlaid on the 'CONFLICT' category of the first row.

This allows her to track it through negotiation and eventual approval or rejection from a science planner. The status and comments are updated dynamically as they are reviewed and/or fulfilled.

# HERO FLOW

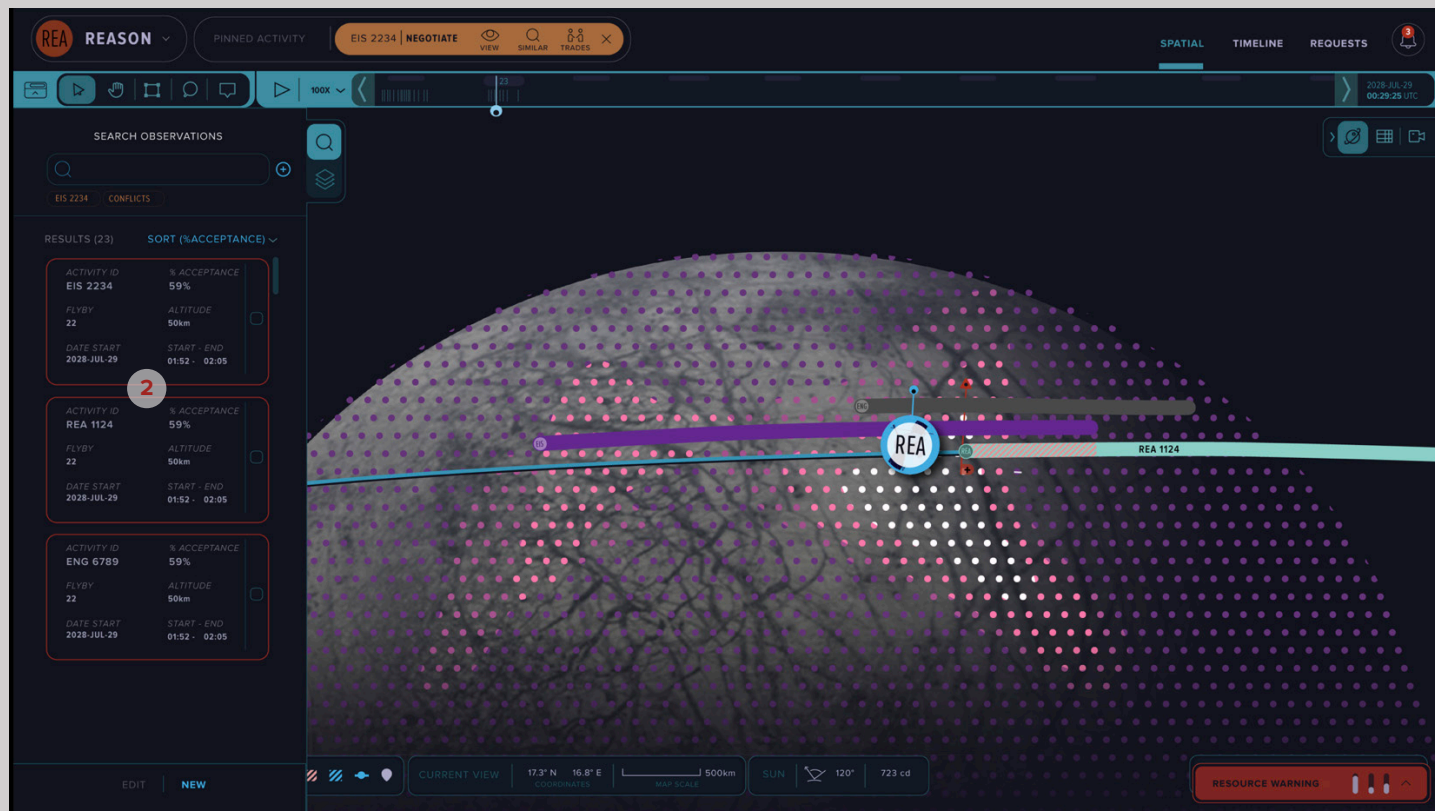

## 2.1 Conflict Resolution

Mary, a REASON instrument scientist, get notified immediately that there's been a request submitted that conflicts with one of their observations.

# HERO FLOW

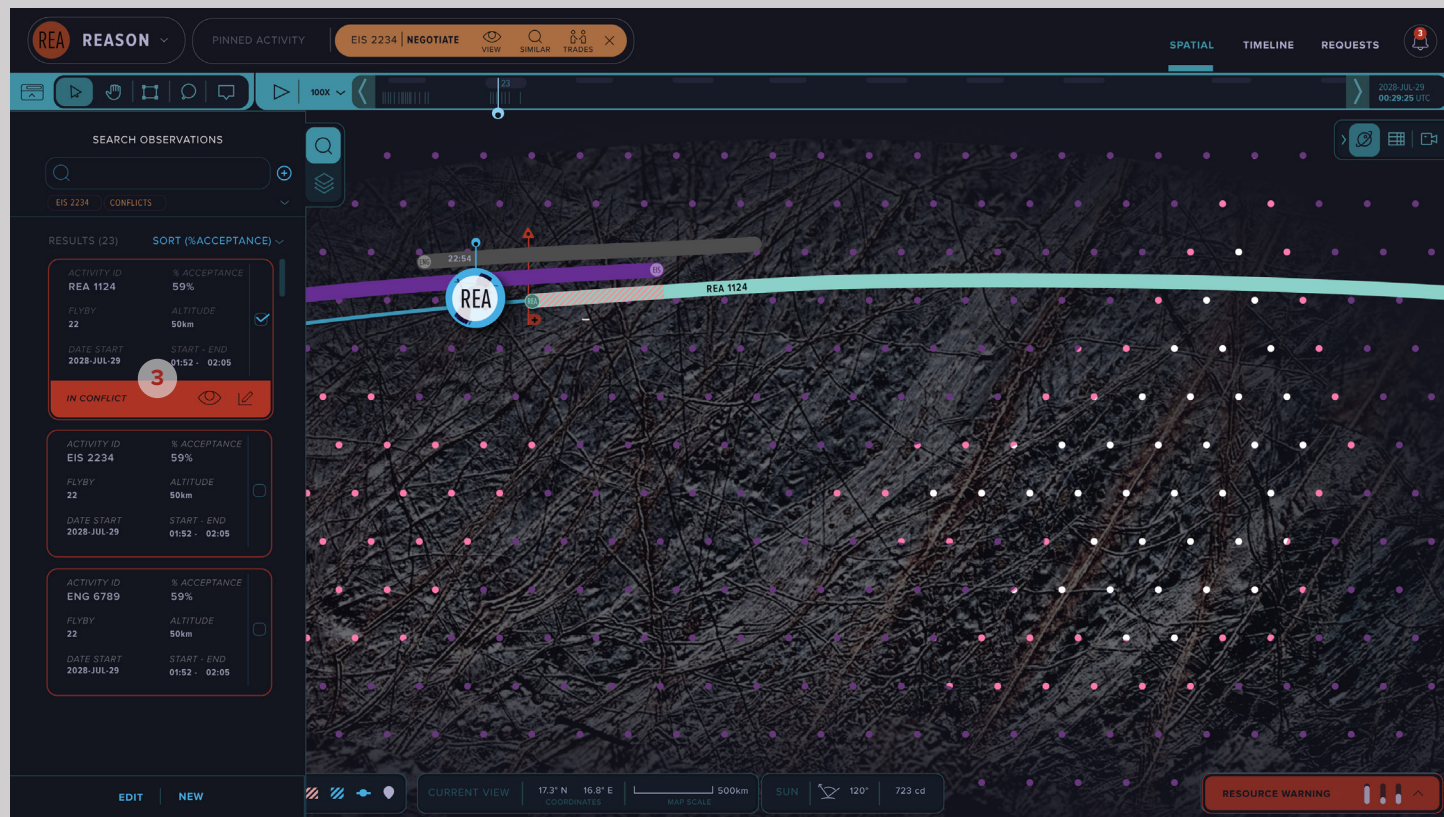

## 2.2 Conflict Resolution

Clicking on that conflict notification allows Mary to visualize all the conflicting activities via the search sidebar.

# HERO FLOW

## 2.3 Conflict Resolution

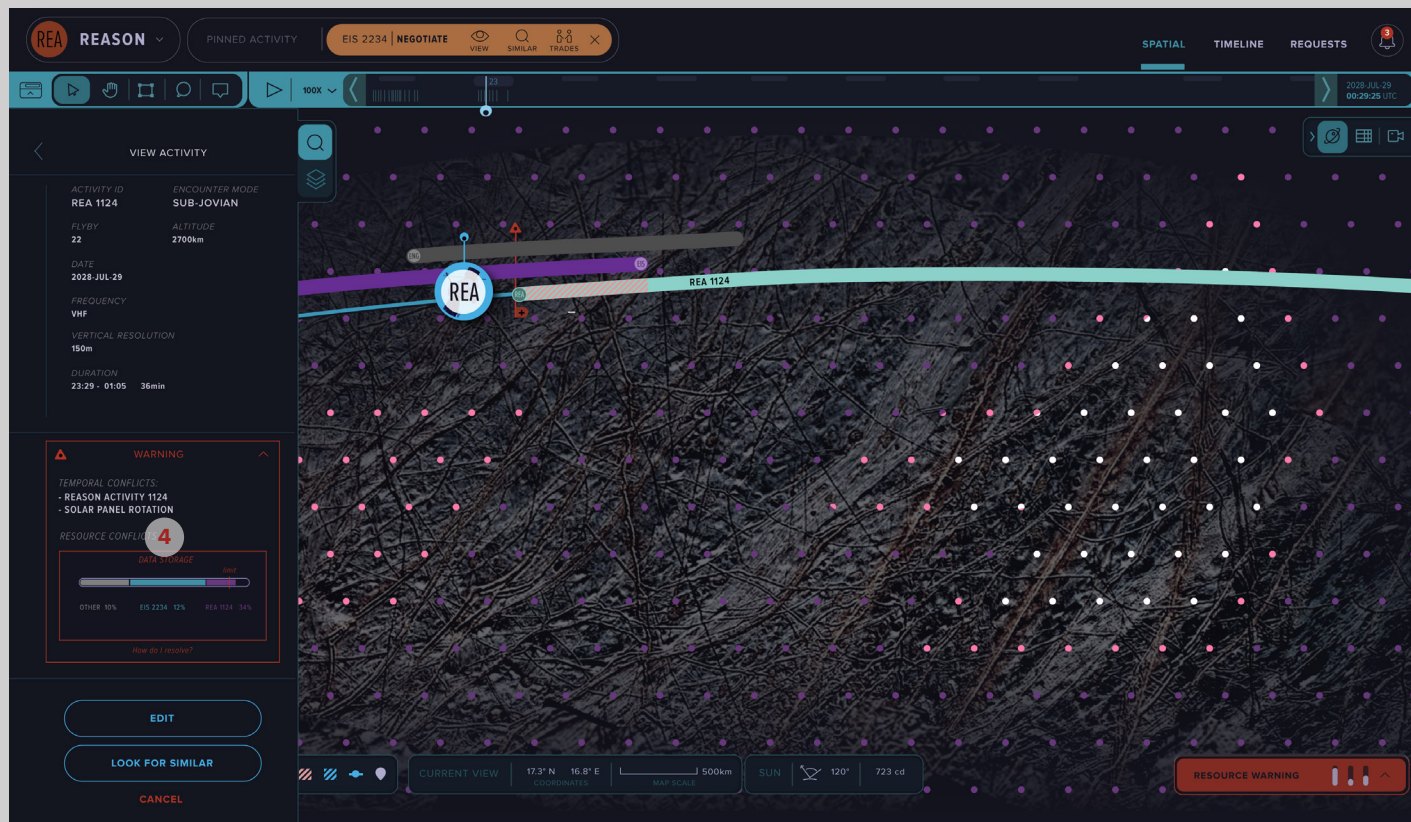

She can view them all at once or individually. Clicking on one shows a simulation of the activity or observation .

# HERO FLOW

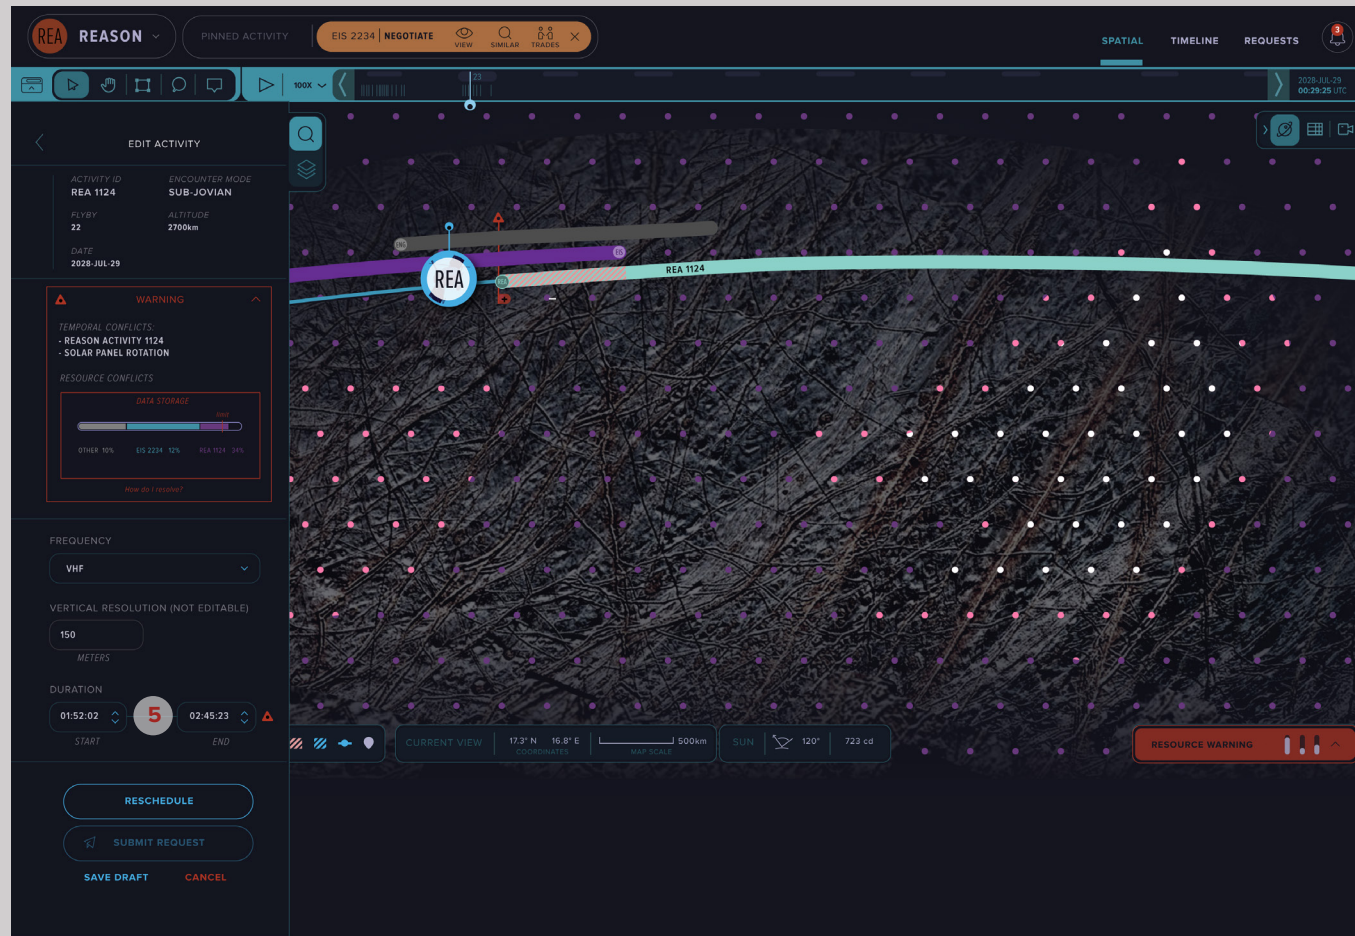

## 2.4 Conflict Resolution

The system gives the user details on the conflicts, explaining succinctly what has caused them and suggesting possible courses of action.

# HERO FLOW

## 2.5 Conflict Resolution

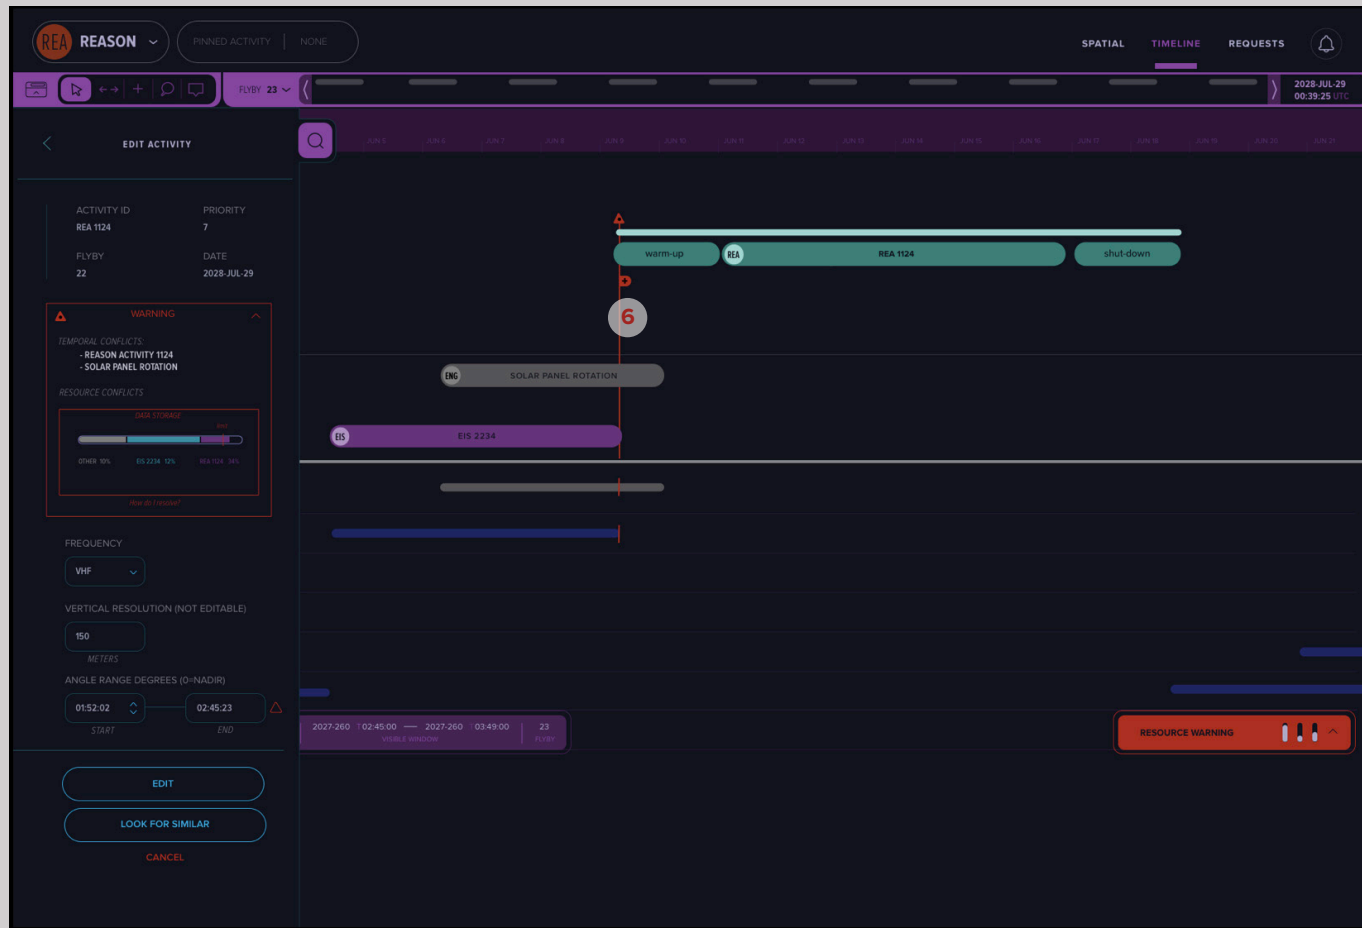

She decides to try to edit her observation to deconflict with EIS, because she knows EIS's observation is high priority, by tweaking observation setting in editing mode.

# HERO FLOW

## 2.6 Conflict Resolution

She can always check the timeline view for a clearer view of the temporal conflicts. She finds that change is not desirable to her or her team unless the spacecraft is passing by this area again on a future flyby. She decides to check.

# HERO FLOW

## 2.7 Conflict Resolution

Going back to the conflicting view, she tries another option to mediate the conflict: searching for opportunities to negotiate with EIS. She starts by selecting the conflicting EIS observation.

# HERO FLOW

## 2.8 Conflict Resolution

From here she can see the details of the EIS activity and a new button shows up that allows her to search for places in the flight plan where she might be able to negotiate a trade with EIS.

# HERO FLOW

## 2.9 Conflict Resolution

The system searches for EIS activities for which REASON might possibly be able to negotiate a trade.

# HERO FLOW

## 2.10 Conflict Resolution

She can view a simulation of each search result.

# HERO FLOW

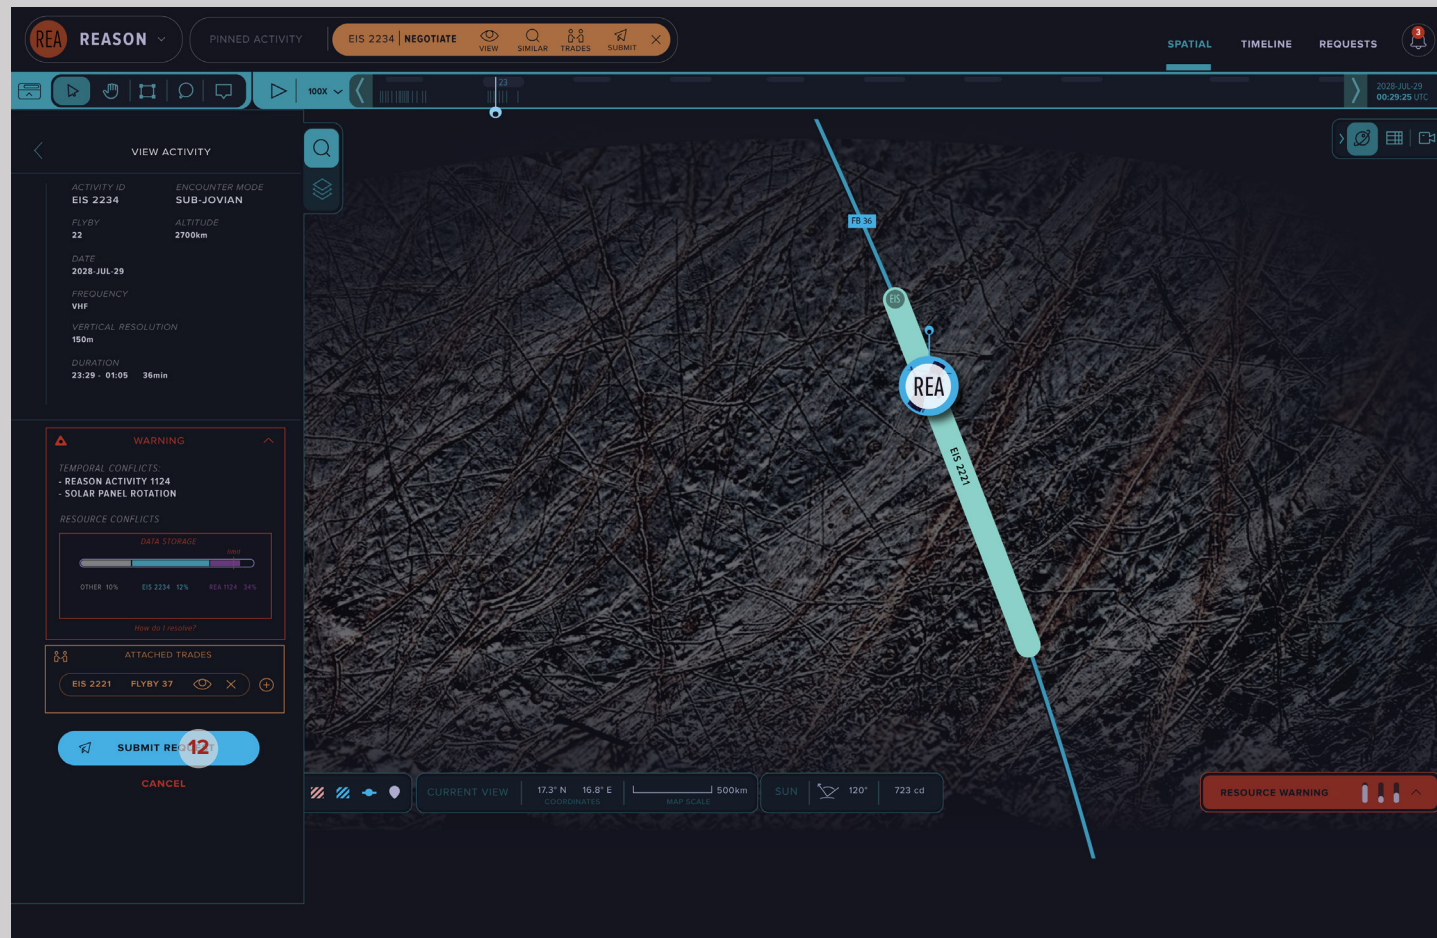

## 2.11 Conflict Resolution

The first search result would be ideal for Mary to make up for the observation time lost on that previous flyby. She adds this activity to her request as a possible trade.

# HERO FLOW

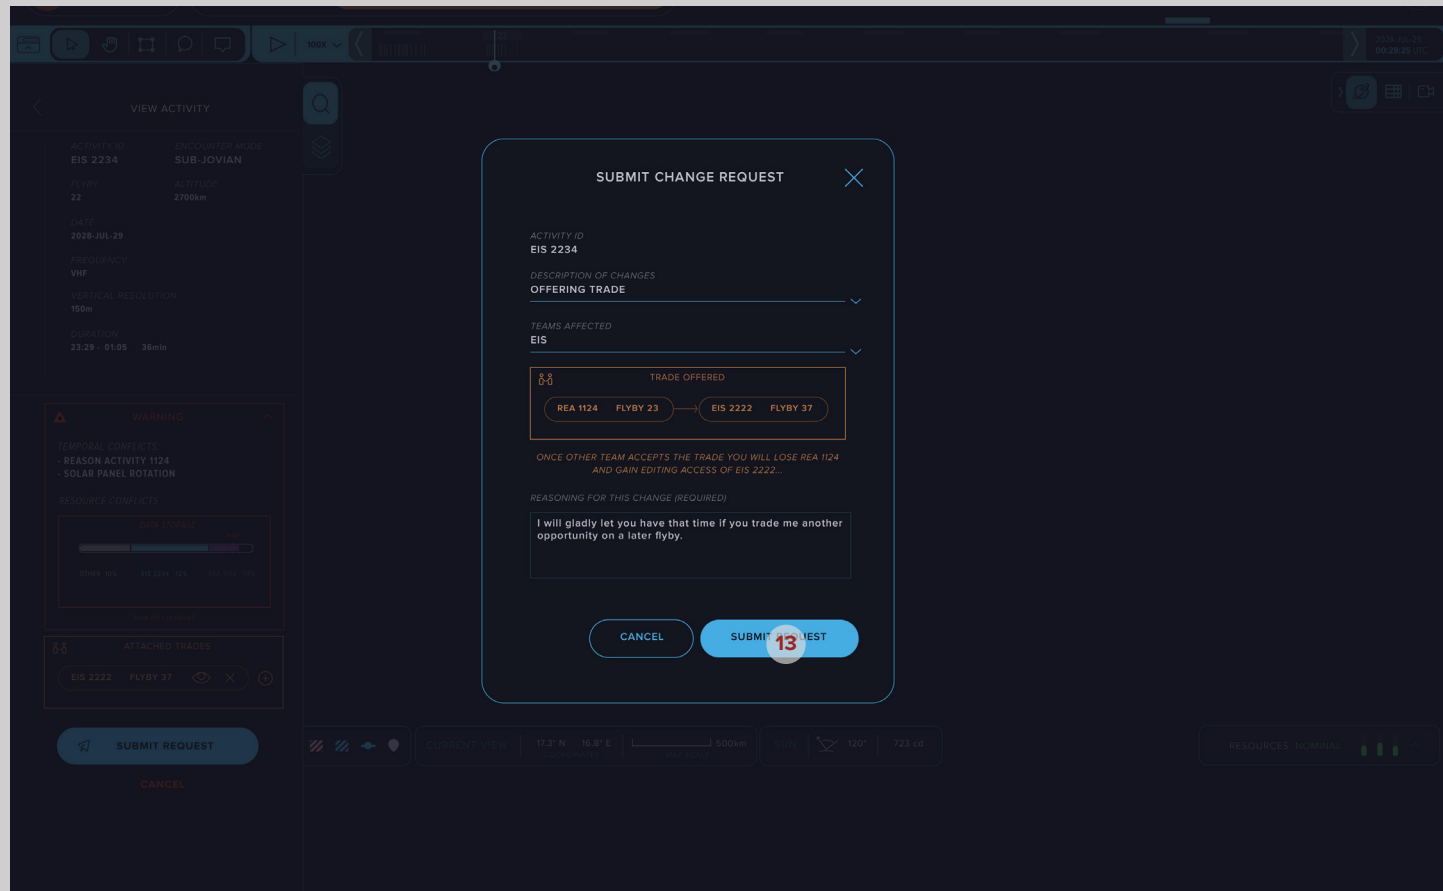

## 2.12 Conflict Resolution

She then submits a request as if she were submitting a change to the plan,

# HERO FLOW

## 2.13 Conflict Resolution

She specifies justification for wanting to make the trade and submits.

# **VISUAL SYSTEM**

High-level details of system grids, UI components and relation between color typeface and interaction elements.

# COLOR

Our interface uses a dark color scheme with secondary color highlights. While this has adapted over many iterations we were originally inspired by the classic car colors of the 1950's and 1960's. During our research interviews we also became enamoured with some of the pop culture references that participant mentioned, there are elements of color use that were pulled from the touch interfaces in Star Trek the Next Generation.

# ICONOGRAPHY

Utilizing a good amount of space between elements and rounding many of the corners of interface elements we provide an interface that both looks easy to navigate and provides enough information for scientists to complete their work. In the same spirit of our design we also looked toward the organic shapes found in classic cars and in Star Trek curvilinear interfaces.

# TYPOGRAPHY

NASA has a rich history that has influenced the very culture of what it means to be American. Our choice of typefaces borrows from the excitement of the 1960's space race while remaining functional and easy to read. Proxima Nova is a more contemporary font based on geometric typefaces with more modern proportions. The use of each weight and color selection is meant to aid users to find data above text descriptions, making it ideal for pro users who do not need as much help with supportive text.
